Question: Consider a unity-gain negative feedback system consisting of the plant G(s) and a proportional-integral controller. Let the proportional gain and integral gain be 3 and 1, respectively. For a unit step reference input, the final values of the controller output and the plant output, respectively, are

$$G(s) = \frac{1}{(s-1)}$$

Solution:

	1	Т
Parameter	Description	Value
K_p	Proportional Gain	3
K_i	Integral Gain	1
r(t)	Reference Input	$u\left(t\right)$
w(t)	Controller Output	?
y(t)	Plant Output	?
F(s)	Feedback Gain	1
C(s)	Controller Gain	$3 + \frac{1}{2}$
e(t)	Error Input	r(t) - y(t)

TABLE 1 PARAMETER TABLE

$$e(t) = r(t) - y(t) \tag{1}$$

In frequency domain:

$$E(s) = U(s) - Y(s) \tag{2}$$

$$=\frac{1}{s}-Y(s)\tag{3}$$

Now from Fig. 1,

$$w(t) = K_p e(t) + K_i \int_0^t e(t) dt$$
 (4)

In frequency domain:

$$W(s) = 3E(s) + \frac{1}{s}E(s)$$
 (5)

$$Y(s) = G(s) W(s)$$
(6)

From equation (3) and (5):

$$Y(s) = \frac{3s+1}{s(s+1)^2}, Re(s) > 0$$
 (7)

By Final Value Theorem:

$$\lim_{t \to \infty} f(t) = \lim_{s \to 0} sF(s) \tag{8}$$

From (8):

$$\lim_{t \to \infty} y(t) = \lim_{s \to 0} sY(s) \tag{9}$$

$$= 1 \tag{10}$$

Substituting equation(3) in equation(5):

$$W(s) = \left(\frac{1}{s} - Y(s)\right)\left(3 + \frac{1}{s}\right) \tag{11}$$

$$=\frac{(s-1)(3s+1)}{s(s+1)^2}, Re(s) > 0$$
 (12)

$$r(t) = u(t) \quad e(t)$$

$$y(t)$$

$$C(s) = K_p + \frac{K_i}{s}$$

$$W(t)$$

$$G(s) = \frac{1}{(s-1)}$$

$$Y(t)$$

$$S(s) = 1$$

$$\lim_{t \to \infty} w(t) = \lim_{s \to 0} sW(s)$$

$$= -1$$

$$\lim_{t \to \infty} w(t) = \lim_{s \to 0} sW(s) \tag{13}$$

$$= -1 \tag{14}$$
